

**INFORMATION**

By configuring the SpaceBeam with skirt and lens, a snoot is constructed giving the Alpha 4K the capability of creating an intense narrow beam (Par Light effect). A focal beam (Beam Projector effect) can also be created simply by changing a lens.

In addition to long throw lighting effects, a space light effect can also be produced. The Alpha 4k Quartz Reflector Technology allows for use of the fixture in the straight down position. By inserting the SpaceBeam on to the Alpha 4K while in this position, a space light effect can be crafted / generated by wrapping the SpaceBeam with its soft, white diffusion fabric.
